	<p>-Direct Treatment</p> <p>-Home Observations</p>	<p>*Fine motor activities for improved hand skills *Gross motor activities for improved strength, endurance, balance, and coordination</p>

Could your child benefit from OT?

Does your child seem to lack body awareness (bumps into things or trips over things)? Does she have delays in motor coordination or appear unusually clumsy? Does your child have difficulty with balance activities or is he uncomfortable with movement activities in general (i.e. swings & slides)? Does your child seem to exert too much force when writing, coloring, cutting, playing with legos, etc? Does your child have difficulty with tasks that require the use of two hands (i.e. scooping and pouring, cutting and writing with one hand while stabilizing the paper with the other)? Does your child seem withdrawn on playground activities? Does your child appear defensive to touch/textures, smells or sounds? Does she excessively crave rough play and show lack of safety awareness? Is he always in motion and has difficulty paying attention? Does your child have difficulty with forming peer relationships or lacks appropriate social skills for age?

If **YES**, I can help! Consider speaking to me about receiving OT consultation or direct service for your child.
